1 Introduction

In Section 2, mainly to promote easier readability and comparability, a transcription of *Beinecke MS 408* is currently being developed, based on a transliteration by **takahashi_voynich_2004**. To achieve this, Takahashi’s transliteration is obtained in an automatically capitalized version of the *European* or *Extensible Voynich Alphabet* (EVA), using the *Interlinear Transcription Archive Extractor* by **schwerdtfeger_voynich_2004**.¹ It is then converted back into glyphs using a font by **bettencourt_voynich_2019**.

Using the manuscript’s reproduction in **clemens_voynich_2016** and the scans provided by Yale University’s **beinecke_voynich_2004**, Takahashi’s transliteration is compared with what I am able to make out of the manuscript on a best guess basis. In total, I made changes in 685 places of Takahashi’s transliteration. Changes to Takahashi’s reading are highlighted in orange:

- Glyphs that I interpret in another way than Takahashi or that I add to the corpus are printed in orange, showing my interpretation.
- When a glyph has been deleted by me without replacement, this is indicated by ✕.
- Removed spaces are marked with ◡ and added spaces are indicated by ◡.
- Added paragraphs are represented by ¶.

Especially the recognition of spaces in running text is, as Takahashi has already noted, sometimes very difficult. As is, in some cases, the distinction of some glyphs (e.g., a and o, a and c\, or ʔ and ʔ). Therefore, my adjustments in this—just as in any other—regard should be taken with a certain amount of caution.

Note that places where the writing is interrupted (e.g., by illustrations) are marked by em dashes (—). Each line of the transcription is preceded by a locator in square brackets, informing about the element a line is part of (i.e., paragraph, title, or label) and assigning the line a number. For example, a line located at [P2, 9] is part of the page’s second paragraph (P2) and is counted as the overall ninth line (9) on this page.

Additionally, in Section 3, some basic analyses are presented. First, in Section 3.1, glyph frequencies are counted. In Section 3.2, then, entropy is calculated.

Of course, this revision would not have been possible without Takeshi Takahashi’s incredible work. Hence, I would like to stress that this is not meant as a criticism of his transliteration; I am merely adding a few carefully selected new interpretations. This work is not comparable to the effort he has put in.

¹ Hence, changes that Takahashi made to his transliteration in subsequent versions are not included. Further note that **schwerdtfeger_voynich_2004** builds on an online archive of Voynich transcriptions maintained by Jorge **stolfi_voynich_1998**. For a general overview of transcription efforts, see **zandbergen_text_2023**.

3 Analysis

3.1 Frequencies

In the following, we take a look at the frequencies of glyphs and words from different perspectives. First, we try to simply count both for the whole manuscript.

3.1.1 Overall Glyph Frequencies and Word Count

Based on a transliteration by Takahashi (see Section 1), a first basic analysis of frequencies can be performed, by simply counting each Latin letter of the transliteration. This results in Table 1, listing all letters that are used (also see Figure 1).

Letter	Representation	Count

Table 1: Letter frequencies in Takahashi’s transliteration.

Determining what counts as *one* glyph, though, is in some cases an interpretative act. It seems straightforward to assume that c and c are one glyph (i.e., c). Likewise, c and c could be interpreted as another glyph (i.e., c). Additionally, one *might* interpret instances of cff, cff, cff, or cff as representing c (or c), on the one hand, and ff, ff, ff, or ff, on the other. Concerning those “gallows” characters, as they have come to be called, it is not clear whether ff and ff or ff and ff are variations of the same glyphs, only diverging in one small loop (as [tiltman_voynich_1967](#) seems to have interpreted them). In the following, the four gallows will be treated as distinct glyphs, as has become customary.

Accordingly, Table 2 gives frequencies for several σ combinations, taking into account four forms of “pedestalled gallows” (also see Figure 2). The table also includes three instances that bear some resemblance to Latin abbreviations (also see **dimperio_voynich_1978**).

Furthermore, while there are instances of a single \setminus , it is not clear whether instances like $\setminus\setminus$ and $\setminus\setminus\setminus$ or combinations with \setminus like $\setminus\setminus$ or $\setminus\setminus\setminus$ represent separate glyphs. Table 3 gives frequencies for several of those \setminus combinations (also see Figure 3). Assuming there are three glyphs \setminus , $\setminus\setminus$, and $\setminus\setminus\setminus$, it is of course difficult to determine when there actually is a $\setminus\setminus$ or a $\setminus\setminus\setminus$.

This being said, I tentatively stipulate a set of 22 glyphs. Table 4 gives frequencies for those glyphs (also see Figure 4). They are counted according to the following rules:

Letter(s)	Glyph	Count (Percent)	
		Takahashi	Takahashi/Bauer
o	o	25,468	(15.636)

3.2 Entropy

Next, let’s take a look at the manuscript’s entropy. To this end, I utilize the conceptualization of information entropy by **shannon_mathematical_1948**, basically measuring the variability of glyphs in the manuscript. Entropy H can be defined as shown in (1), where p_z denotes the probability of z , with z being an element of the alphabet Z .

$$H = - \sum_{z \in Z} p_z \log_2 p_z \quad (1)$$

To calculate the entropy, I suppose the above stipulated glyphs to form alphabet Z (see Table 4). Accordingly, changes to the corpus are made so that each stipulated glyph has a single corresponding character in the transliteration. Changes are made according to the following rules:

- The glyph $œ$ is represented by **Sh** in EVA. For calculating the entropy, every time **S** and **h** appear consecutively, they are replaced by **1**
- The glyph $œ$ is represented by **ch** in EVA. Every time **c** and **h** appear consecutively, they are replaced by **2**. Following the above stated rules for glyph counting, $œ$ is also believed to be present when **c** and **h** are separated by ff , ff , ff , or ff , represented by **T**, **K**, **P**, or **F** in EVA. In those cases, it is believed that ff , ff , ff , or ff are also present. They are represented by **t**, **k**, **p**, or **f** in EVA. Hence, they are replaced by **2t**, **2k**, **2p**, or **2f**.

Figure 4: Glyph frequencies in Takahashi's transliteration.

- The glyph \mathfrak{z} , represented by \mathfrak{z} in EVA, is counted as \mathfrak{l} , represented by \mathfrak{k} in EVA. Hence, every \mathfrak{z} is replaced by \mathfrak{k} .
- The glyph \mathfrak{iin} is represented by \mathfrak{iin} in EVA. Every time \mathfrak{i} , \mathfrak{i} , and \mathfrak{n} appear consecutively, they are replaced by 3.
- The glyph \mathfrak{in} is represented by \mathfrak{in} in EVA. Every time \mathfrak{i} and \mathfrak{n} appear consecutively, they are replaced by 4.
- Lastly, the glyph \mathfrak{I} , represented by \mathfrak{I} in EVA, is counted as \mathfrak{i} , represented by \mathfrak{i} in EVA. Hence, every \mathfrak{I} is replaced by \mathfrak{i} .

Calculating the entropy for this converted corpus results in $H = 3.866$. As comparisons, Table 5 also offers the entropy values for the unconverted transliteration as well as for a randomly generated text consisting of 22 different characters and being 234,956 characters long (just as the converted transliteration).
