Beinecke MS 408

A Transcription Based on a Revised Version of Takeshi Takahashi's Transliteration

Alexander Max Bauer

Contents

1 Introduction

In Section 2, mainly to promote easier readability and comparability, a transcription of *Beinecke MS 408* is currently being developed, based on a transliteration by Takahashi (1999). To achieve this, Takahashi's transliteration is obtained in an automatically capitalized version of the *European* or *Extensible Voynich Alphabet* (EVA), using the *Interlinear Transcription Archive Extractor* by Schwerdtfeger (2004).[1] It is then converted back into glyphs using a font by Bettencourt (2019).

Using the manuscript's reproduction in Clemens (2016) and the scans provided by Yale University's Beinecke Rare Book and Manuscript Library (2004), Takahashi's transliteration is compared with what I am able to make out of the manuscript. In total, I made changes in 367 places of Takahashi's transliteration. Changes to Takahashi's reading are highlighted in orange:

- Glyphs that I interpret in another way than Takahashi or that I add to the corpus are printed in orange, showing my interpretation.

- When a glyph has been deleted by me without replacement, this is indicated by ✗.

- Removed spaces are marked with ⌢ and added spaces are indicated by ⌣.

- Added paragraphs are represented by ¶.

Especially the recognition of spaces in running text is, as Takahashi has already noted, sometimes very difficult. Therefore, my adjustments in this—just as in any other—regard should be taken with a certain amount of caution. Note that places where the writing is interrupted by illustrations are marked by em dashes (—).

Each line of the transcription is preceded by a locator in square brackets, informing about the element a line is part of (i.e., paragraph, title, or label) and assigning the line a number. For example, a line located at [P2, 9] is part of the page's second paragraph (P2) and is counted as the overall ninth line (9) on this page.

Additionally, in Section 3, some basic analyses are presented. First, in Section 3.1, glyph frequencies are counted. In Section 3.2, then, entropy is calculated.

---

1 Schwerdtfeger (2004) builds on an online archive of Voynich transcriptions maintained by Jorge Stolfi (1998). For a general overview of transcription efforts, see Zandbergen (2023).

3 Analysis

3.1 Glyph Frequencies

Based on a transliteration by Takahashi (see Section 1), a first basic analysis of frequencies can be performed, by simply counting each Latin letter of the transliteration. This results in Table 1, listing all letters that are used.

Letter	Glyph	Count Takahashi	Takahashi/Bauer
o	o	25,468	
e	ɕ	20,070	
h	ɬ	17,856	
y	૧	17,655	
a	ɑ	14,281	
c	ɕ	13,314	
d	ઠ	12,973	
i	ˋ	11,660	
l	૧	10,518	
k	ƒ	9,996	
r	૨	7,456	
n	૨	6,141	
t	ƒ	5,968	
q	ꝑ	5,423	
S	૩	4,501	
s	૨	2,886	
p	ƒ	1,406	
m	૪	1,116	
T	ƒ	976	
K	ƒ	938	
f	ƒ	425	
P	ƒ	224	
g	૬	96	
F	ƒ	80	
I	ⲧ	72	
x	ⲭ	35	
v	⋀	9	
z	ƕ	2	

Table 1: Letter frequencies in Takahashi's transliteration.

Determining what counts as *one* glyph, though, is in some cases an interpretative act. It seems straightforward to assume that ɕ and ɬ are one glyph (i.e., ɕɬ). Likewise, ૩ and ɬ could be interpreted as another glyph (i.e., ૩ɬ). Additionally, one *might* interpret instances of ɕƒɬ, ɕƒɬ, ɕƒɬ, or ɕƒɬ as representing ɕɬ (or ૩ɬ), on the one hand, and ƒ, ƒ, ƒ, or ƒ, on the other. Concerning those "gallows" characters, as they have come to be called, it is not clear whether ƒ and ƒ or ƒ and ƒ are variations of the same glyphs, only diverging in one small loop (as Tiltman 1967 seems to have interpreted them). In the following, the four gallows will be treated as distinct glyphs, as has become customary. Accordingly, Table 2 gives frequencies for several ɕ combinations, taking into account four forms of "pedestalled gallows". The table also includes three instances that bear some resemblance to Latin abbreviations (also see D'Imperio 1978, p. 95).

Furthermore, while there are instances of a single ˋ, it is not clear whether instances like ˋˋ and ˋˋˋ or combinations with ૨ like ˋ૨ or ˋˋ૨ represent separate glyphs. Table 3

Letter(s)	Glyph	Count	
		Takahashi	Takahashi/Bauer
ch	ᴄᴄ	11,008	
Sh	ᴄᴄ	4,501	
cTh	cᵮc	950	
cKh	cᵮc	906	
cPh	cᵮc	216	
cFh	cᵮc	74	
c	ᴄ	143	
co	ᴄo	9	
cy	ᴄ9	7	

Table 2: Glyph frequencies in Takahashi's transliteration for several ᴄ combinations.

gives frequencies for several of those ᴠ combinations. Assuming there are three glyphs ᴠ, ᴠꝽ, and ᴠᴠꝽ, it is of course difficult to determine when there actually is a ᴠꝽ or a ᴠᴠꝽ.

Letter(s)	Glyph	Count	
		Takahashi	Takahashi/Bauer
i	ᴠ	590	
ii	ᴠᴠ	195	
iii	ᴠᴠᴠ	10	
n	Ᵹ	148	
in	ᴠꝽ	1,752	
iin	ᴠᴠꝽ	4,076	
iiin	ᴠᴠᴠꝽ	154	
iiiin	ᴠᴠᴠᴠꝽ	2	

Table 3: Glyph frequencies in Takahashi's transliteration for several ᴠ combinations.

This being said, I tentatively stipulate a set of 22 glyphs. Table 4 gives frequencies for those glyphs. They are counted according to the following rules:

- The glyphs ɑ, ꝸ, ᴄ, �, ⲧ, ꝗ, ꝷ, o, ꝉ, ꝑ, ꝛ, ʌ, ҳ, and 9 are simply counted as before. Hence, frequencies are identical with Table 1.

- The glyph ᴄᴄ is counted every time ꝱ and ᴄ appear consecutively.

- The glyph ᴄᴄ is counted every time ᴄ and ᴄ appear consecutively, as well as in cases where there is ᵮ, ᵮ, ᵮ, or ᵮ between them.

- The glyph ᵮ is counted every time ᵮ or ᵮ appears.

- The glyph ᵮ is counted every time ᵮ, ᵮ, or ꝼ appears.

- The glyph ᵮ is counted every time ᵮ or ᵮ appears.

- The glyph ᵮ is counted every time ᵮ or ᵮ appears.

- The glyph ᴠꝽ is counted every time ᴠ and Ᵹ appear consecutively without there being a preceding second ᴠ.

- The glyph ᴠᴠꝽ is counted every time ᴠ, ᴠ, and Ᵹ appear consecutively.

- The glyph ᴠ is counted every time it is not part of ᴠꝽ or ᴠᴠꝽ as well as in instances of ⲧ.

Letter(s)	Glyph	Count (Percent)	
		Takahashi	Takahashi/Bauer
o	o	25,468 (15.636)	
e	c	20,070 (12.322)	
y	๑	17,655 (10.839)	
a	ɑ	14,281 (8.768)	
ch	ᴄᴛ	13,154 (8.076)	
d	প	12,973 (7.965)	
k	ℍ	10,934 (6.713)	
l	૧	10,518 (6.458)	
r	૨	7,456 (4.578)	
t	ℍ	6,944 (4.263)	
q	†	5,423 (3.329)	
Sh	ᴄᴌ	4,501 (2.763)	
iin	∖∖ᗅ	4,232 (2.598)	
s	૨	2,886 (1.772)	
in	∖ᗅ	1,752 (1.076)	
p	ℍ	1,630 (1.001)	
i	∖	1,240 (0.761)	
m	৪	1,116 (0.685)	
f	ℍ	505 (0.310)	
g	ঀ	96 (0.059)	
x	ᴢ	35 (0.021)	
v	ʌ	9 (<0.001)	
		162,878	

Table 4: Glyph frequencies in Takahashi's transliteration

3.2 Entropy

Next, let's take a look at the manuscript's entropy. To this end, I utilize the conceptualization of information entropy by Shannon (1948), basically measuring the variability of glyphs in the manuscript. Entropy H can be defined as shown in (1), where p_z denotes the probability of z, with z being an element of the alphabet Z.

$$H = -\sum_{z \in Z} p_z \log_2 p_z \tag{1}$$

To calculate the entropy, I suppose the above stipulated glyphs to form alphabet Z (see Table 4). Accordingly, changes to the corpus are made so that each stipulated glyph has a single corresponding character in the transliteration. Changes are made according to the following rules:

- The glyph ᴄᴌ is represented by `Sh` in EVA. For calculating the entropy, every time `S` and `h` appear consecutively, they are replaced by `1`

- The glyph ᴄᴛ is represented by `ch` in EVA. Every time `c` and `h` appear consecutively, they are replaced by `2`. Following the above stated rules for glyph counting, ᴄᴛ is also believed to be present when `c` and `ᴛ` are separated by ℍ, ℍ, ℍ, or ℍ, represented by `T`, `K`, `P`, or `F` in EVA. In those cases, it is believed that ℍ, ℍ, ℍ, or ℍ are also present. They are represented by `t`, `k`, `p`, or `f` in EVA. Hence, they are replaced by `2t`, `2k`, `2p`, or `2f`.

- The glyph ℍ, represented by `z` in EVA, is counted as ℍ, represented by `k` in EVA. Hence, every `z` is replaced by `k`.

- The glyph ⟨ⁱⁱ⟩ is represented by `iin` in EVA. Every time `i`, `i`, and `n` appear consecutively, they are replaced by `3`.

- The glyph ⟨ⁱ⟩ is represented by `in` in EVA. Every time `i` and `n` appear consecutively, they are replaced by `4`.

- Lastly, the glyph ⟨τ⟩, represented by `I` in EVA, is counted as ⟨ⵁ⟩, represented by `i` in EVA. Hence, every `I` is replaced by `i`.

Calculating the entropy for this converted corpus results in $H = 3.866$. As comparisons, Table 5 also offers the entropy values for the unconverted transliteration as well as for a randomly generated text consisting of 22 different characters and being 234,956 characters long (just as the converted transliteration).

Corpus	H
Takahashi	4.021
Takahashi (converted)	3.866
Takahashi/Bauer	
Takahashi/Bauer (converted)	
Random text	4.459

Table 5: Entropy (H) for different transliterations.
